Application No. 10/664,622 Amendment dated April 7, 2005

Reply to Office Action of October 17, 2004

Express Mail No.: EV 597771825 US

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of the claims in this application.

**Listing of Claims:** 

1. (Currently Amended) An isolation mechanism for a boomed apparatus, wherein the

boomed apparatus includes a movable boom and a control assembly comprising substantially

electrically conductive control valves located at a general distal end of the boom, the isolation

mechanism comprising:

a <u>substantially electrically non-conductive</u> control handle <del>which is</del> actuatable by a worker to

provide a control input; and

a linkage including a substantially electrically non-conductive material and operable to

couple the control handle with the control assembly so as to communicate the control

input therebetween, thereby providing a dielectric gap between the control handle and

the movable boom to substantially electrically isolate the control handle from the

control assembly and the movable boom

a linkage configured for positioning proximate to the distal end of the boom and substantially

external to the boom, the linkage operable to couple the control handle with the

control assembly so as to communicate the control input therebetween, the linkage

further including a substantially electrically non-conductive material, such that the

structural combination of the linkage being external to the boom and including the

substantially electrically non-conductive material results in the linkage providing a

<u>dielectric</u> gap between the control handle and the movable boom to substantially

electrically isolate the control handle from the control assembly and the movable

boom to thereby prevent bodily injury to the worker.

Express Mail No.: EV 597771825 US

2. (Previously Presented) The isolation mechanism as set forth in claim 1, wherein the

substantially electrically non-conductive material is selected from the group consisting of: plastic,

fiberglass, nylon, rubber, and carbon fiber.

3-16. (Canceled)

17. (Currently Amended) An isolation mechanism for a boomed apparatus, wherein the

boomed apparatus includes a movable boom and a control assembly positioned in proximity to a first

end of the boom, the isolation mechanism comprising:

a <u>substantially electrically non-conductive</u> control handle, positioned in proximity to [[the]]

a first end of the boom, which is actuatable by a worker to provide a control input;

and

a linkage including a substantially non-conductive material, the linkage configured for

positioning proximate to the first end of the boom and substantially external to the

boom and operable to couple the control handle with the control assembly so as to

communicate the control input therebetween, thereby providing a dielectric gap

between the control handle and the boom to substantially electrically isolate the

control handle from the control assembly and the boom to thereby prevent bodily

injury to the worker.

18. (Previously Presented) The isolation mechanism as set forth in claim 17, wherein the

control handle includes a substantially electrically non-conductive material.

19. (Previously Presented) The isolation mechanism as set forth in claim 17, wherein the

substantially electrically non-conductive material is selected from the group consisting of: plastic,

fiberglass, nylon, rubber, and carbon fiber.

20-21. (Cancelled)

22. (New) An isolation mechanism for a boomed apparatus comprising a movable boom and a control assembly, the isolation mechanism comprising:

means for providing control input to the boom; and

means for producing a dielectric gap between the control handle and the movable boom to substantially electrically isolate the control handle from the movable boom to thereby prevent bodily injury to the worker.
